

ScropIDS

AI-Powered Intrusion Detection & Security Monitoring Platform

ScropIDS is a production-oriented security platform built for organisations that need real-time visibility into endpoint activity, automated threat detection, and actionable alerts — all in one unified SOC dashboard.

The Problem with Modern Threat Detection

Enterprise environments generate **millions of security events daily**. Traditional approaches rely on analysts manually sifting through raw logs — a process that is slow, inconsistent, and increasingly untenable for lean security teams.

Log Overload

Modern distributed systems produce enormous volumes of security telemetry across endpoints, services, and networks — far beyond human capacity to review in real time.

Slow Response

Manual analysis introduces critical delays. Threats that should be detected in seconds instead linger unnoticed for hours or days, dramatically increasing blast radius.

Error-Prone

Human reviewers suffer from alert fatigue, inconsistency, and cognitive bias — leading to missed detections and false negatives that put organisations at risk.

Our Solution: ScropIDS Architecture

ScropIDS addresses every layer of the detection gap — from endpoint event collection to AI-powered analysis and dashboard visibility — through a fully integrated, production-ready pipeline.

Each component is independently scalable. Celery and Redis handle asynchronous task queues, ensuring the LLM analysis layer never blocks event ingestion — even under high-throughput conditions.

Core Platform Features

ScropIDS ships with a complete feature set designed to meet the operational demands of real SOC environments — from multi-tenant isolation to AI-driven alert generation.

Multi-Tenant Support

Full organisational isolation with scoped data, agents, and alerts. Each tenant operates in a secure, independent context.

LLM-Based Threat Analysis

Aggregated logs are passed to an LLM via OpenRouter or OpenAI-compatible APIs to identify suspicious patterns and generate contextual threat summaries.

Agent Enrollment & Auth

Agents enroll via a secure token-based authentication flow, ensuring only verified endpoints can submit events to the platform.

SOC Dashboard & Alerts

A clean React-based dashboard surfaces alerts, agent status, scheduler jobs, and organisation-level metrics in a single pane of glass.

Event Ingestion API

A high-performance REST API accepts structured security events from agents at scale, with schema validation and deduplication.

Technology Stack

ScropIDS is built entirely on battle-tested, open-source technologies — chosen for performance, developer ergonomics, and production reliability.

Backend & Infrastructure

Django & DRF

Core API framework with REST endpoints, ORM-based data modelling, and admin tooling.

PostgreSQL & Redis

Persistent relational storage paired with Redis for caching and Celery task brokering.

Celery

Asynchronous task queues power the LLM analysis pipeline without blocking event ingestion.

Frontend, Agent & LLM

React + Vite + TypeScript

Fast, type-safe frontend with Tailwind CSS for a responsive, dark-mode SOC interface.

Go Agent

Lightweight, cross-platform endpoint agent compiled to a single binary for minimal footprint.

OpenRouter / Ollama

Flexible LLM integration supporting cloud APIs and local model deployments for air-gapped environments.
